## ABOUT THE BOOK

In East Asia, if we include the number of plants planned for operation in the future, this number reaches approximately 170 plants. If an accident occurs at a nuclear power plant in the East Asian region, the impact on both the home country and neighboring countries would be tremendous. The issue of nuclear safety is no longer a domestic issue. This book suggests that the exchange of experiences involving nuclear power plant safety, efforts towards common safety standards, human resource development, and collaborative efforts between Japan, China, and South Korea are extremely urgent issues. This book will be widely read by the people who have interest in nuclear power risk and nuclear power safety. Especially researchers, graduate students and policy makers who study in the field of nuclear energy and energy policy will be the major readership of the book.
